Introduction

This municipal human settlement demand profile has been generated by the Western Cape Department of Human Settlements for human settlement planning purposes. A range of data sources have been used, but the profile is based heavily on Census 2011 data. Data sources are provided below each graph or table. Where data has been manipulated, a methodology is provided in the end notes to this profile. The profile has been generated automatically using an online database with additional analysis added. Users will be able to update the data or view multiple representations of the data online. Separate Data Scoping and Housing Market Segment Reports were also prepared as informants to the demand profile and are referred to throughout the report.

The profile is presented according to the three components of human settlements: Housing, Networked Infrastructure and Social Infrastructure, followed by Trends, Analysis and Discussion.

Definitions

Term	Definition
Adequate housing:	All Census 2011 dwelling types excluding informal dwellings and informal backyard shacks. Includes traditional dwellings and formal backyard structures.
Dwelling type:	Census 2011 dwelling types, with the following three categories aggregated: Cluster/Townhouse/Semi-detached house (includes: Cluster house in complex; Townhouse (semi-detached house in a complex); and Semi-detached house); House/flat/room on other property (includes: House/flat/room in backyard; and Room/flatlet on a property or larger dwelling/servants quarters/granny flat); and Other (includes: Caravan/tent; and Other).
Housing status:	A re-categorisation of Census 2011 dwelling types, isolating those considered inadequate (informal dwelling and informal backyard dwelling) and adding a calculated figure for overcrowding. All other housing types in Census 2011 are considered adequate.
Inadequate housing:	Census 2011 figures for informal dwellings, informal backyard shacks and a calculated figure for overcrowding.
Income:	Household monthly income in 2011, modified from Census 2011 as described in end note 1.
Informal dwelling:	Census 2011 dwelling type: "Informal dwelling (shack; not in backyard; e.g. in an informal/squatter settlement or on a farm)", defined in the Census metadata as "Makeshift structure not approved by a local authority and not intended as a permanent dwelling. Typically built with found materials (corrugated iron, cardboard, plastic, etc.). Contrasted with formal dwelling and traditional dwelling."
Informal backyard shack:	Census 2011 dwelling type: "Informal dwelling (shack; in backyard)".

Term	Definition
Informal settlement:	All households (in any dwelling type) in Census 2011 settlement category: "Informal residential area".
Overcrowding:	A calculated figure based on an assumption of more than two people per room (as measured in the 2011 Census) resulting in overcrowding, and requiring an additional room for every two people. The number of overcrowded households is calculated using the assumption of one household and two rooms in every new dwelling. See end note 2 for a full explanation of the methodology.
Rural:	Census 2011 settlement categories: "Farms", Small holdings" and "Traditional residential".
Urban:	All Census 2011 settlement types excluding those included in the definition of Rural (above).

Housing

Dwelling type vs income profile

A description of the methodology used to re-categorise households using the Census 2011 monthly income brackets is provided in end note 1.

Figure 1: Proportion of households in each dwelling type by monthly household income bracket

Table 1: Number of households by dwelling type and monthly household income category

(Source: Census 2011)

Stellenbosch has a relatively standard dwelling type profile across income brackets. The proportion of standalone formal houses increases from a relatively low 37% in the lowest income bracket to approximately 83% in the upper income bracket. The proportion of inadequate houses decreases as income increases. Informal dwellings make up the majority of inadequate housing below R3 500 per month. Informal housing (dwellings and backyard shacks) are most prevalent in the R0 – R800 income bracket, which is also the bracket with the most total households. It is alarming to note that over a quarter of houses in the R0 to R1 500 brackets are informal dwellings. Approximately 61% of the households fall into the R0-R3 500 income bracket and 91% of the households fall into the potentially subsidised R0-R15 000 income bracket.

Registered Housing Demand

From Western Cape Housing Demand Database

This section presents data from the official Housing Demand Database of the Western Cape Department of Human Settlements, which collates the housing demand data of all the non-

metro municipalities. The figures presented here represent the 'registered demand', meaning those people that have put their names down on the municipal housing lists. It does not reflect the total demand in the municipality, which would comprise other households not registered on the database.

Total **registered housing demand** as at 2nd April 2015 for Stellenbosch Local Municipality was recorded as **19 749**.

Present accommodation

Choice of assistance

Figure 3: Number and proportion of households on the Housing Demand Database each assistance option

Source: Western Cape Housing Demand Database

Choice of tenure

Figure 4: Number and proportion of households on the Housing Demand selecting each tenure option

Source: Western Cape Housing Demand Database

Stellenbosch has 44% non-respondent to the question on present accommodation in the Western Cape Housing demand database. The majority of those that did answer (almost 23% of the total) indicated that they lived in wooden or iron structures (most likely informal dwellings or informal backyard shacks). Almost 19% of the total questioned stated that they lived with the owner or main tenant of a house or flat. The Western Cape Housing Demand Database also questioned the type of assistance which the person would like assistance with, although in this case 81% of respondents responded with either a “None/Other” response, and 16% stated that they would prefer assistance with a free standing house. Almost all of the respondents stated that they would like to have a house that they own as opposed to rent.

Housing status

Housing status refers to whether the dwelling type is considered 'adequate' or not. Inadequate housing comprises informal dwellings, informal backyard shacks and overcrowded dwellings. See the definitions and endnote 2 for a full explanation of the methodology employed to calculate overcrowding.

The total calculated number of inadequately housed households is **11 834**.

Housing status by income

Figure 5: Proportion of households in each housing state by monthly household income bracket

	R0-R800	R801-R1 500	R1 501-R3 500	R3 501-R7 500	R7 501-R11 500	R11 501-R15 000	R15 001-R20 000	R20 001-R30 000	>R30 000	Total

Table 2: Number of households by housing status and monthly household income bracket

(Source: Census 2011)

The total calculated number of inadequately housed households (comprising those in informal dwellings, informal backyards and overcrowded dwellings) is **11 834**, which represents **26 %** of the total.

Stellenbosch has an interesting mix of dwelling type by income bracket. There is an interesting decrease in the proportion of adequate households from the R0 – R800 income bracket to the R801 – R1 500 income bracket. The overall mix of household is roughly similar

up to R3 500, and then there is a sharp decline in the number of inadequate households. There are 641 households earning above R7 500 per month that are inadequately housed, the majority of which are informal dwellings (267) with significantly smaller numbers of overcrowded dwellings (206) and 168 higher income backyard shacks. Inadequately housed households earning less than R 7 500 per month are mainly informal dwellings, informal backyard shacks and overcrowded dwellings.

Housing status by income and age

The figures and tables below present the same data as for Figure 5 and Table 2, but divided into household heads aged below 40 years (Figure 6) and those above 40 years (Figure 7).

Figure 6: Proportion of household heads below 40 years in each housing state by monthly household income bracket

	R0-R800	R801-R1 500	R1 501-R3 500	R3 501-R7 500	R7 501-R11 500	R11 501-R15 000	R15 001-R20 000	R20 001-R30 000	>R30 000	Total

Total	4 165	1 965	4 353	4 300	2 106	1 126	990	1 461	3 384	23 850

Table 4: Number of household heads aged **above** 40 years in each housing state by monthly household income bracket

Source: Census 2011

The shape of the housing status by income group for households headed by people under the age of 40 is significantly different to those which are headed by people over the age of 40. Over the age of 40, there is a clear decreasing trend for inadequate housing as income increases. Approximately 75% of households in the lowest income band are adequate, and this gradually increases as income increases. The majority of the inadequate houses are informal dwellings until the income becomes R7 500 per month, and thereafter the majority are overcrowded dwellings. For households headed by individuals under the age of 40, there is a significant decrease (from 54% to 40%) of adequate houses between income bands R0 to R800 and R801 to R1 500. The proportion of informal dwellings significantly increases between these bands. Above R7 500 per month the number and proportion of inadequate households decreases significantly.

Dwelling type by age of household head

Figure 8: Proportion of households in each dwelling type by age bracket of household head

Source: Census 2011

There are a significant portion of household heads between the ages of 18 and 30 residing in flats or apartments in a block of flats. This is likely due to the fact that a significant portion of the population of Stellenbosch Municipality are students living in university residences or private flat accommodation. The overall trend indicates a strong correlation between income and age, rather than a relationship between age and dwelling type.

Urban/Rural split of inadequate housing

The figure and table below aggregate Census settlement types into those classified as 'urban' and 'rural' (see definitions) and present the number of inadequately housed households in these two settlement categories to illustrate where the housing challenge lies.

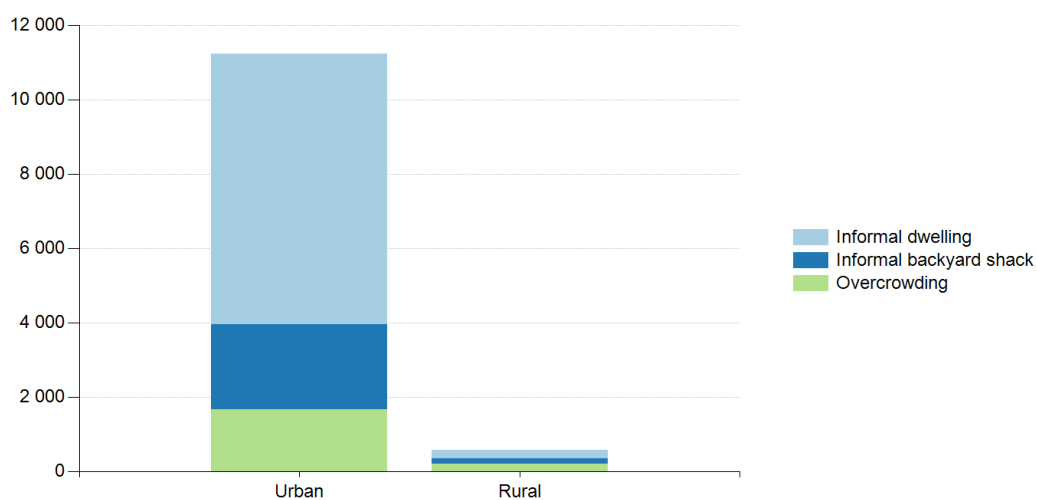

Figure 9: Number of inadequately housed households by housing status and settlement type

	Urban	Rural	Total
Informal dwelling	7 273	231	7 504
Informal backyard shack	2 305	139	2 444
Overcrowding	1 657	197	1 854
Total	11 235	567	11 802

Table 5: Number of inadequately housed households by housing state and settlement type

Source: Census 2011

The urban/rural split of inadequately housed households clearly shows that the housing challenges are concentrated in the urban areas of Stellenbosch Municipality. The small proportion of rural households that are inadequately housed are split between the three types of inadequacy, while in urban areas the main challenges are informal dwellings, followed by informal backyard shacks and overcrowding.

Tenure

This section analyses the current tenure status of households, according to the Census categories, by the variables of: income, age and employment.

Tenure status by housing status

	Informal backyard shack	Informal dwelling	Adequate	Overcrowding	Total
Other	80	571	1 704	74	2 429
Occupied rent-free	571	5 418	6 596	815	13 400
Rented	1 442	270	11 324	460	13 496
Owned but not yet paid off	25	128	4 169	53	4 375
Owned and fully paid off	326	1 116	9 680	475	11 597
Total	2 444	7 503	33 473	1 877	45 297

Table 6: Number of households in each tenure category and housing state

Source: Census 2011

Note: The Housing Market Segments Report noted that the figures for ownership of informal dwellings and informal backyard shacks are not reliable as there is some uncertainty over the legal status of these dwellings and the properties on which they are located.

Tenure status by monthly income group

Figure 10: Proportion of households in each tenure category by monthly household income bracket

	R0-R800	R801-R1 500	R1 501-R3 500	R3 501-R7 500	R7 501-R11 500	R11 501-R15 000	R15 001-R20 000	R20 001-R30 000	>R30 000	Total

Table 8: Number of households in each tenure category and age bracket of household head

Source: Census 2011

Stellenbosch Municipality has fewer housing units which are owned and fully paid off than other similar municipalities. The trend is only gradually increasing as income increases. The largest income bank is R0 – R800, and in this band there are a large number of houses which are occupied rent free, as well as rented for a fee. The proportion of dwellings which are occupied rent free increases significantly in the next income band (R801 – R1 500). As alluded to previously, there is a tendency for rental in the lower age bracket of 18-30 years. The proportion of rent stays quite equal between income groups. There is an average paid rental figure of 28.5% of households.

Housing status by age and employment status of household head

The Housing Market Segments Report identified employment status as an important determinant of housing and tenure preference. The tables below illustrate the split in housing status according to both age and employment status to more accurately identify the socio-economic profile of housing demand.

Employed household heads

	18-30 years	31-40 years	41-50 years	51-60 years	61 years and older	Total
Informal dwelling	1 970	1 571	667	187	34	4 429
Informal backyard shack	702	604	279	66	15	1 666
Overcrowding	231	512	394	174	32	1 343
Adequate	3 870	5 031	5 959	4 236	1 635	20 731
Total	6 773	7 718	7 299	4 663	1 716	28 169

Table 9: Number of employed household heads in each housing state and age bracket

Source: Census 2011

Unemployed household heads

	18-30 years	31-40 years	41-50 years	51-60 years	61 years and older	Total
Informal dwelling	1 277	931	474	238	127	3 047
Informal backyard shack	309	209	109	73	65	765
Overcrowding	193	154	113	86	90	636
Adequate	3 860	1 028	1 404	1 907	4 488	12 687
Total	5 639	2 322	2 100	2 304	4 770	17 135

Table 10: Number of unemployed household heads in each housing state and age bracket

Source: Census 2011

There are more households headed by employed people than unemployed people. The analysis of housing status by age and employment status of household head indicates that there are 26% of households headed by employed people living in inadequate housing. These households are mainly informal dwellings followed distantly by informal backyard

shacks and overcrowded dwellings. 74% of the houses headed by unemployed people are adequate, which is the same proportion as those headed by employed persons.

Estimated subsidy non-qualification

The National Housing Code specifies the conditions for qualification for assistance through one of the national housing programmes. The four essential qualification criteria that have been used to calculate the number of non-qualifiers in the municipality are:

1. South African resident;
2. 18 years old and above;
3. Not have previously benefited from a government housing subsidy assistance;
4. Did not previously own residential property;
5. Married or cohabiting or with financial dependents;
6. Earning less than the qualifying monthly household income threshold

Most subsidy programmes apply to households earning less than R3 500 per month, but the Finance-Linked Subsidy Programme (FLISP) applies to households earning between R3 500 and R15 000 per month.

A detailed description of the process to calculate the number of non-qualifiers for housing subsidies is provided in end note 3. The income criteria have been included in the analysis by presenting the data in two graphs: one for households earning R0 - R3 500 per month and one for households earning R3 500 - R 15 000. The age criterion has been included by only counting households where the household heads are aged above 18 years. The reasons for non-qualification are therefore given on the figures below as:

1. Being a foreign born resident
2. Having received a housing subsidy previously - from the Western Cape Housing Subsidy System
3. Having previously owned a house (without subsidy assistance) - Households currently owning property less those having received a subsidy
4. Not having dependents - measured as households of only 1 person

The numbers of households who do not qualify for housing subsidies have been calculated using a range of sources, and should therefore be treated as an estimate only. Note that the Housing Subsidy System does not record the number of subsidies awarded by municipality, so these have had to be split by the proportions of low income households in each municipality in relation to the provincial total.

There are estimated to be **14 931** households earning below R3 500 per month and **6 534** households earning between R3 500 and R15 000 per month that do not qualify for subsidies. This amounts to 63 % of households earning less than R3 500 per month and 56 % of households earning between R3 500 and R15 000 per month. This does not account for the ability of households to access credit as an additional qualification criterion for the FLISP.

Note: These are estimates generated through the study and are meant to provide an indicative sense of the status of subsidy non-qualification.

Estimated subsidy non-qualifiers earning less than R3 500 / month

Profile of informal settlements

Overall statistics

Indicator	Source	Year	Total
Total number of informal settlements	Western Cape Informal Settlement Database	2011	21
	Western Cape Informal Settlement Database	2014	21
Total number of informal settlement dwellings	Western Cape Informal Settlement Database	2011	7 430
	Western Cape Informal Settlement Database	2014	6 754
Total number of households in informal residential areas	Census	2011	7 657
Total number of households in informal dwellings	Census	2011	7 503

Table 11: Overall statistics on informal settlements

Note: Figures from the Western Cape Informal Settlements Database for 2014 have not yet been verified.

The figures below are based on an analysis of the Census data for households in informal dwellings, and not for the informal residential settlement category (see definitions section for more details). In most municipalities the number of households in informal dwellings is higher than the number of households in informal residential areas, and the former number is therefore believed to be more inclusive.

Income profile of households in informal dwellings

Figure 14: Proportion of households in informal dwellings in each monthly household income bracket

Source: Census 2011

Age profile of household heads in informal dwellings

Figure 15: Number and proportion of household heads in informal settlements in each age bracket

Source: Census 2011

Employment status of household heads in informal dwellings

Figure 16: Number and proportion of informal settlement household heads by employment status

Source: Census 2011

About 96% of the 7 504 informal dwellings in Stellenbosch Municipality earn less than R7 500 per month. The vast majority of household heads (77%) are aged between 18 and 40 years. Only 2% are aged above 60 years. 59% of informal dwelling household heads are employed.

Networked Infrastructure

This section looks at access to engineering services by housing type to try and identify where the largest numbers of un-serviced households lie. The Census data for the three services of water, sanitation and electricity are then cross-tabulated against each other to provide an indication of the number of households that have none of the three services, relative to their housings status. It is not possible to include overcrowded households in this analysis because of the structure of the Census data.

Definitions used for un-serviced households

Water: No access to piped water within 200m

Electricity: Lack of access to electricity for lighting

Sanitation: Lack of access to waterborne toilet facilities or Ventilated Improved Pit toilet

Waste: Service levels other than kerbside collection

ICT: No access to the internet from home

Lack of access to networked services

	Water	Electricity	Sanitation	Waste	ICT
Informal dwelling	1 691	2 122	1 481	792	7 443
Informal backyard shack	120	244	481	102	2 401
Adequate	425	704	1 416	3 697	25 782
Total	2 236	3 070	3 378	4 591	35 626

Table 12: Number of un-serviced households by service and housing status

Source: Census 2011

Percentage of un-serviced households by service

	Water	Electricity	Sanitation	Waste	ICT
Informal dwelling	23 %	28 %	20 %	11 %	99 %
Informal backyard shack	5 %	10 %	20 %	4 %	98 %
Adequate	1 %	2 %	4 %	11 %	77 %

Table 13: Percentage of households in each housing state that are un-serviced with each service

Source: Census 2011

Households in Stellenbosch are not very well serviced. 9% of all household do not have regularly and well managed waste collection, while 28% of informal dwellings do not have access to electricity, along with inadequate sanitation access to 20% of both informal dwellings and informal backyard shacks. Landline internet access to all categories of housing is low.

Number of un-serviced households (combined water, electricity and sanitation services)

	R0- R800	R801-R1 500	R1 501- R3 500	R3 501- R7 500	R7 501- R11 500	R11 501- R15 000	R15 001- R20 000	R20 001- R30 000	>R30 000	Total
Informal dwelling	66	33	39	3	1	0	0	0	0	142
Informal backyard shack	7	4	4	4	0	0	0	0	0	19
Adequate	10	11	14	4	2	1	1	1	0	44
Total	83	48	57	11	3	1	1	1	0	205

Table 14: Number of households in each settlement type without water sanitation and electricity

Source: Census 2011

The cross tabulation of access to water, sanitation and electricity shows that there are some of households that do not have access to all three services, 205 households in total. Most of these households are informal dwellings (142). There are also 44 adequate households that have no access to services.

Dependence on public transport

The only complete data set relating to public transport was the Census data on household access to private motor cars. This indicator gives an indication of exclusive dependence on public transport.

	Stellenbosch	Percentage of households in each housing status category without motor car
Informal dwelling	7 084	94.4%
Informal backyard shack	2 227	91.1%
Adequate	15 208	45.4%
Total	24 519	56.5%

Table 15: Number of households with no access to a private motor car

Source: Census 2011

There are 24 519 households (almost 57%) that do not have access to a private motor car and are therefore assumed to be reliant on public or non-motorised transport.

Social Infrastructure

The social infrastructure analysis investigated data on a range of provincial social facilities and municipal community facilities and compared these against norms and standards provided in the CSIR Guidelines for the Provision of Social Facilities in South African Settlements (2012). The CSIR Guidelines provide nuanced guidance regarding the norms to be applied in various contexts. These norms comprise distance and population thresholds for settlements of different sizes. The population thresholds only have been simplified and used here only to benchmark existing provision, and the thresholds should be critically assessed using the CSIR Guidelines for planning purposes. An explanation of the method for selecting the population thresholds and for data manipulation is provided in endnote 4.

Indicators for facilities for which there are no CSIR norms, or where data is highly variable between municipalities have been omitted. For most of the CSIR norms, a range is provided. For comparison purposes, the average value is used, except where this average value is greater than the municipal population, in which case the minimum of the range is used.

The indicator that is used in each category of social infrastructure is the average population per facility of each type, using the estimated municipal population in **2014** as projected by PwC for the Western Cape Department of Social Development.

Coverage of health facilities

	Average population per facility	CSIR Norm	Coverage relative to norm
Public Clinics	8 662	47 000	Better

Table 16: Coverage of health facilities (Sources: Directorate: Planning - Geographic Information Systems, Western Cape Government: Department of Human Settlements)

Coverage of education facilities

	Average population per facility	CSIR Norm	Coverage relative to norm
Secondary School	14 961	12 500	Worse
Primary School	5 486	7 000	Better
Early Childhood Development and Creche	1 469	2 700	Better

Table 17: Coverage of education facilities (Sources: Directorate: Planning - Geographic Information Systems, Western Cape Government: Department of Human Settlements; Directorate: Research, Population and Knowledge Management - Western Cape Government: Department of Social Development)

Note that coverage of creches only includes facilities registered on the provincial database and does not include unregistered creches.

Coverage of safety facilities

	Average population per facility	CSIR Norm	Coverage relative to norm
Police stations	27 429	80 000	Better

Table 18: Coverage of safety facilities (police stations) (Source: Directorate: Planning - Geographic Information Systems, Western Cape Government: Department of Human Settlements)

Coverage of other public facilities

	Average population per facility	CSIR Norm	Coverage relative to norm
Local Libraries	27 429	45 000	Better
Thusong Centres	0	164 575	Worse
Cemeteries	0	50 000	Worse

Table 19: Coverage of other public facilities (Source: Directorate Planning - Geographic Information Systems, Western Cape Government: Department of Human Settlements; City of Cape Town)

Note that where zeros appear for Thusong Centres and cemeteries this may be because of a lack of data.

From the available data, Stellenbosch Municipality appears to be adequately served by public clinics, primary schools, Early Childhood Development Centres, police stations and local libraries. The area is inadequately served by secondary schools, Thusong Centres and cemeteries however.

Note that this is in relation to the CSIR population threshold norm for the equivalent category of settlement, and does not consider distance thresholds.

Trends

Selected trends relevant to human settlements

Indicator	Source	Value	WC Average
Annual average economic growth (2001-2011)	Quantec	5.3 %	4.1 %
Annual average household growth rate (2001-2011)	Census	2.1 %	3.1 %
Annual average population growth rate (2001-	Census	2.8 %	2.6 %

Indicator	Source	Value	WC Average
2011)			
New informal settlements (2011-2014)	WC Informal Settlement Database	0	1
Percentage change in household size (2001-2011)	Census	6.1 %	-0.5 %

Table 20: Selected trends relevant to human settlements

Stellenbosch Local Municipality contains the very high potential growth town of Stellenbosch as measured by the 2014 Growth Potential of Towns Study.

Analysis and discussion

General discussion

Stellenbosch Municipality faces a significant human settlements challenge. Approximately 26% of households are inadequately housed and 55% earn less than R3 500 per month. Stellenbosch is a well-run and administratively sound municipality, but it is facing a huge influx of people searching for economic opportunities. Annual growth is below provincial average, but it is already a very populous municipality so is starting from a very high base. Economic growth is high, which should enable more people to move their way from needing assistance to being able to access housing unsubsidised. There is evidence of household consolidation, which is likely to lessen the potential housing demand, although it may lead to overcrowding.

The number of inadequately housed households was calculated to be 11 834, while the Western Cape Housing Demand Database records 19 749. This difference may be a result of an overestimate on the database (most likely), significant growth since the Census, or errors in the interpretation and manipulation of the Census figures to calculate housing status. However, these two figures provide useful ranges for the planning of human settlement interventions.

A key finding is that many household heads in informal dwellings are employed (59%), indicating that they may be able to contribute to housing and services. While this raises the option of rental, the location of the informal settlements needs to be borne in mind, because the location may be key to accessing employment opportunities and minimising recurrent costs.

Households in Stellenbosch are not very well serviced with 28% of informal dwellings not having access to electricity, along with inadequate sanitation access to 20% of both informal dwellings and informal backyard shacks. Further, the area is inadequately served by secondary schools, Thusong Centres and cemeteries.

Overall Housing Market Segmentation

The diagram below provides an estimate of the number of households in each of the market segments identified in the Housing Market Segments Report. There are three dimensions to

the figure. Firstly, the horizontal axis is divided into the standard income brackets used in this report, corresponding to subsidy qualification criteria or credit limits identified in the Housing Market Segments Report. Secondly, the vertical axis is divided into the rental and ownership markets. Thirdly, the rental and ownership markets are divided into subsidy qualifiers and non-qualifiers, based on the estimates provided earlier in this profile. See end note 4 for an explanation of the ownership/rental division and the split of non-qualifying households. See end note 5 for a detailed description of the components of the housing market segment diagram.

Figure 17: Legend for Housing Market Segmentation

Figure 18: Housing Market Segmentation

Sources: Census 2001; Western Cape Housing Subsidy System 2014; own calculations

The diagram calculates the size of each market in the municipality, but does not compare this against the number of inadequately housed households, which is substantially less than the number of potential subsidy qualifiers. It has not been possible to calculate how many of the inadequately housed households do not qualify for subsidy assistance. However, the total figure for non-qualifiers is relatively large, and may be of concern to the municipality given that these households are likely to remain in informal circumstances. The gap market in Stellenbosch has been calculated to be 2 740 households, made up of 2 393 households in the supply and credit gap, and 347 households in the credit gap.

End notes

1. Income bracket adjustment

All representations of household data by income bracket have involved the manipulation of Census 2011 data to align with new monthly income brackets defined in the Housing Market Segments Report. The Census 2011 Annual Household Income was first converted into a monthly income figure. The number of households in the new monthly income bracket was calculated by adding the proportion of the new monthly income bracket that straddled the Census income monthly brackets, multiplied by the number of households in each of the Census monthly income brackets. Simple linear interpolation was used, which assumes that households are evenly distributed across income monthly brackets. The figure below illustrates the process used to calculate the number of households falling into the new monthly income bracket between R 1 500 and R 3 500 per month.

2. Overcrowding calculation

The methodology used to calculate overcrowding is based on the methodology used by the City of Cape Town for the modelling undertaken for the Integrated Human Settlements Framework. The point of departure was a definition of overcrowding given by the U.S Department of Housing and Urban Development: Office of Policy Development & Research (2007) Measuring Overcrowding in Housing (available online at http://www.huduser.org/publications/pdf/measuring_overcrowding_in_hsg.pdf) of more than 2.5 people per habitable room (i.e. excluding kitchens, bathrooms, store rooms, etc.). However, the South African Census does not distinguish between habitable and non-habitable rooms. Therefore the definition was modified to be more than 2 people per (total) room. This assumes that there are four habitable rooms for every non-habitable room, which is believed to produce a roughly equivalent outcome to that of the US Department of Housing and Urban Development definition.

To determine the number of households that are overcrowded, the following methodology was followed:

Step	Description
Step 1:	Census data for household size and number of rooms was cross-tabulated, producing a table indicating the number of households having 1 person in 1 room, 2 people in 1 room, 1 person in 2 rooms, etc., each of which represents a occupancy 'case'.
Step 2:	For each case, the number of overcrowded people was determined by taking the household size and subtracting the number of rooms multiplied by 2 (people per room - representing the theoretical maximum comfortable occupancy level), producing the number of overcrowded people per 'case'.
Step 3:	The number of overcrowded people was divided by 2 (people per room) to produce the number of additional rooms required per 'case'.
Step 4:	The number of additional rooms was divided by an assumed value of 2 for the number of rooms in a new house to produce the number of households requiring accommodation per 'case'. While the average number of rooms per formal dwelling in the Western Cape is higher than this (4.72), the lower figure is based on the size of new IRDP housing. The assumption therefore indicates the need for a new house (and therefore 1 overcrowded household) for every four people in an overcrowded dwelling.
Step 5:	The number of households requiring accommodation per 'case' was multiplied by the number of households in each case (see step 1) to produce the number of overcrowded households.

The following example illustrates the process:

Step	Description
Step 1:	There are 120 households living in the housing case: 10 people living in 2 rooms
Step 2:	Number of overcrowded people = $10 - (2 \times 2) = 6$
Step 3:	Number of additional rooms required = $6 \div 2 = 3$
Step 4:	Number of additional dwellings required = $3 \div 2 = 1.5$ - rounded up to 2.
Step 5:	Number of households overcrowded = $120 \times 2 = 240$.

3. Subsidy non-qualifiers

The subsidy conditions stipulate the following five essential criteria:

Criterion	Description
Criterion 1:	Must be a South African resident
Criterion 2:	Must be 18 years or older
Criterion 3:	Must not have previously benefited from a government housing subsidy
Criterion 4:	Must not have previously owned residential property
Criterion 5:	Must be married or cohabiting or with financial dependents
Criterion 6:	Must have a household income of R0-R3 500 per month for a full subsidy, or R3 500 - R 15 000 for a FLISP subsidy.

The following data sets were used as direct or proxy measures for the above criteria:

Criterion	Description
Criterion 1:	Census 2011
Criterion 2:	Census 2011
Criterion 3:	WC Housing Subsidy System
Criterion 4:	Census 2011

Criterion	Description
Criterion 5:	Census 2011
Criterion 6:	Census 2011 and WC Housing Demand Database

The following process was followed:

Step	Description
Step 1:	The number of households in each qualifying income bracket was extracted from Census 2011 (Criterion 6) and cross-tabulated against age (Criterion 2) and tenure status (Criteria 3 and 4).
Step 2:	The number of single person households (Criterion 5) per income bracket was extracted from Census 2011.
Step 3:	The number of foreign individuals (Criterion 1) was extracted from Census 2011 and divided by an assumed household size of 2 to calculate the number of foreign-headed households. These households were distributed proportionately between the revised income brackets according to the split of the total municipal population.
Step 4:	The number of non-qualifying households calculated in Steps 1, 2 and 3 were added together to obtain the total number of non-qualifying households in each income group.

Given the lack of a full data set on many of the criteria, and the inability to cross-tabulate across the various data sets, the following assumptions had to be made:

Step 1 assumes that a) all people who have previously owned property still owned their properties in 2011 and b) that all those that have received a subsidy still own their properties. Both of these simplifying assumptions will tend to underestimate the number of non-qualifiers. In addition, it ignores the in-migration of people who have received a subsidy in another province, thereby assuming that this does not take place, or nets out with subsidy beneficiaries leaving the province. As there is positive net in-migration to the province, this assumption will tend to underestimate the number of non-qualifiers.

Step 2 assumes that any household greater than 1 person either comprises a spouse, co-habiting partner or financial dependent. As the definition of 'household' in Census 2011 could include 2 financially independent and unrelated adults, this assumption will tend to overestimate the number of subsidy qualifiers, and thus underestimate the number of non-qualifiers.

Step 3 assumes that foreign residents are distributed across income groups in the same proportions as the total population, and on average form households of 2 people. As there is no data to support these assumptions, the impact of this assumption is unknown.

All of the assumptions made in steps 1 and 2 underestimate the number of non-qualifiers. However, there is an element of double counting where single person households own their dwellings, and therefore these two dynamics may tend to cancel on another out.

4. Tenure preference

Tenure propensity is a combination of preference and circumstance. In many cases, households may prefer to own a property, but may not be able to afford to do so. In other cases, people may be able to afford a house, but prefer to rent (for various reasons). Two sources of data were used to determine tenure propensity. Firstly, the tenure preference of households is indicated in the Western Cape Human Settlements Demand Database. Understandably, this data illustrates a very clear preference for home ownership amongst all income brackets. Secondly, the existing tenure arrangements as measured by Census 2011 provide an indication of tenure propensity forced through circumstance, as well as preference to rent at higher income levels. However, many of these households would opt to own rather than rent if they had a choice. Analysis of the Census data undertaken for the Housing Market Segments Report concluded that there appears to be a minimum of 20% of household at all income brackets that would prefer to rent. Given these data sources and their inherent weaknesses, the following methodology was followed to determine the split of households likely to own versus rent in each income bracket:

1. The average value was calculated between the current percentage of households that rent (or live rent free) from Census 2011 and the percentage of households that stated a preference to rent in the WC Housing Demand Database.
2. If this value for rental propensity was greater than the observed minimum of 20% of households in any income bracket, then the average value was used, otherwise the 20% value was used.

5. Housing Market Segmentation

A housing market segment report produced for this study which, based on a desktop literature review and stakeholder engagements, constructed a framework for understanding housing markets in the Western Cape province. The key housing demand dimensions were identified to be household income (monthly in this study), tenure status (ownership versus rental) and state housing finance qualification criteria. Based on these key dimensions, the housing market segments were delineated according to the categories in **Error! Reference source not found..**

Tenure status and related housing programmes	Monthly household income (Rands)						
	0 - 800	801 - 1 500	1 501 - 3 500	3 501 - 7 500	7 501 - 11 500	11 501 – 15 000	>15 001
Owned							
State-subsidised housing	x	x	x				
Supply & credit gap				x			
Finance Linked Individual Subsidy Programme (FLISP)				x	x	x	
Credit gap					x		
Non-qualifiers	x	x	x	x	x		
Bonded							x
Rental							
Community Residential Units (CRU)		x	x				
Social Housing			x	x			
Non-qualifiers	x	x	x	x			
Normal rental					x	x	x

Table 21: Housing market segmentation

Source: Own assessment based on literature and stakeholder engagements

The nature of these categories is explained in **Error! Reference source not found..**

Tenure status and related housing programmes	
Owned	
State-subsidised housing	State housing finance mechanisms for households earning below R3 500/month.
Supply & credit gap	The Housing Market Segments Report identified a supply and credit gap in the R3 500-R 7500 income bracket. This means the market is unwilling or unable to supply a product that could be afforded by households in this bracket, even if they were able to access credit and the FLISP subsidy.
Finance Linked Individual Subsidy Programme (FLISP)	For households earning between R3 500 and R15 000/month, the FLISP programme is available. However, not all households within the FLISP income band are able to access it due to the lending limit (household income of R11 500). Such households then represent part of the 'gap' market whose needs are partially being met through Financial Sector Charter loans.
Credit gap	The housing market segment report identified a credit gap in the R7 500-R11 500 income bracket indicating that 60% of households in this bracket would be unable to access the credit required as a condition of the FLISP subsidy.
Non-qualifiers (owners)	While there are a number of programmes which households can access to meet their demand, there are also notable limitations to their capacity to access such opportunities. If a household does not meet the qualification criteria of state-funding or those of lending institutions, they fall into a category of 'non-qualifiers'. It is inferred, on the basis of the literature reviewed, that many of these non-qualifiers are reverting to residence in informal dwellings (such as shacks or traditional housing) to meet their demand. Some such non-qualifiers include, but are not limited to, non-South African citizens or parties who may have previously benefited from state housing programmes.
Bonded	Beyond an income of R15 000 households are expected to revert to the bonded market.

Rental	
Community Residential Units (CRU)	State housing programmes for households earning between R800 and R3 500/month.
Social Housing	State housing programmes for households earning between R1 500-R7 500/month.
Non-qualifiers (rental)	While there are a number of programmes which households can access to meet their demand, there are also notable limitations to their capacity to access such opportunities. If a household does not meet the qualification criteria of state-funding or those of rental institutions or landlords, they fall into a category of 'non-qualifiers'. It is inferred, on the basis of the literature reviewed, that many of these non-qualifiers are reverting to residence in informal dwellings (such as shacks or traditional housing) to meet their demand. Some such non-qualifiers include, but are not limited to, non-South African citizens or parties who may have previously benefited from state housing programmes.
Normal rental	It is still not fully clear what the income band boundary between the non-qualifier and normal rental markets are but it is assumed these overlap partially at an income of R7 500/month.
