

To raise awareness on STI's

Sexually Transmitted Infections are transmissible and carry health risks if left untreated.

Sexually Transmitted Infections (STIs) are spread from one person to another in the following ways:

- Unprotected sexual contact.
- Bodily fluids.
- If you touch the infected area of another person and then yourself.
- From mother to child during pregnancy and birth.
- By sharing needles.
- People living with HIV have a higher risk of contracting an STI as the virus attacks cells in the immune system, which is our body's natural defence against illness.
- Using a condom properly can reduce the risk of getting infected.
